

CSPE-FT-GT - Spring Pallet Elevator

Spring Pallet Elevator: How it Works

This innovative machine utilises a scissor-like platform powered by a series of strategically placed springs. The magic lies in the number & strength of the springs installed. This allows you to tailor the elevator to handle specific weight ranges, from a modest 200kg to a substantial 2000kg.

When you place a pallet onto the platform, the springs compress, smoothly raising the load to an ergonomic working height. This eliminates the need for workers to bend over, significantly reducing strain on the back and promoting a safer, more comfortable work environment.
